Load Balancing Strategies for Distributed Systems

Description

Having a large distributed system, like Cloud or Grid, one need to manage load balancing between each instance. This means if one machine is overloaded then some of the applications which are running on the machine should be migrated to another one.

The aim of the seminar is to provide an overview of existing load balancing strategies for Cloud and Grid Systems.

The provided literature can be seen as a starting point and it is expected to extend the literature search and present a coherent view on the current state of the art in this area.
